Quiz, 9 questions

1 point

1.

(Difficulty:  $\star$ ) Write out the phase of the complex numbers  $a_1=1-{f j}$  and  $a_2=-1-{f j}.$ 

Express the phase in degrees and separate the two phases by a single white space. Each phase should be a number in the range [-180,180].

1 point

2.

(Difficulty:  $\star$  ) Let  $W_N^k=e^{-\mathrm{j}\frac{2\pi}{N}k}$  and N>1. Then  $W_N^{N/2}$  is equal to...

\_1

1

) -:

 $e^{-\mathrm{j}(2\pi/N)+N}$ 

Quiz, 9 questions

3.

(Difficulty:  $\star$ ) Which of the following signals (continuous- and discrete-time) are periodic signals?

Note that  $t \in \mathbb{R}$  and  $n \in \mathbb{Z}$ .

$$oxed{ x[n] = e^{-\mathrm{j}2\pi f_0 n}}$$
, where  $f_0 = \log(3)$ .

$$x[n] = 1.$$

$$x(t) = t - floor(t).$$

4.

(Difficulty:  $\star\star\star$ ) Choose the correct statements from the choices below.

Consider the length-N signal  $x[n] = \cos(rac{2\pi}{N}Ln + \phi),$  where N is even and L = N/2. Then

$$X[k] = egin{cases} rac{N}{2}e^{\mathrm{j}\phi} & ext{ for } k \equiv L \ 0 & ext{ otherwise} \end{cases}.$$

- Consider the length-N signal  $x[n]=(-1)^n$  with N even. Then X[k]=0 for all k except k=N/2
- If we apply the DFT twice to a signal x[n], we obtain the signal itself scaled by N, i.e. Nx[n].

Quiz, 9 questions

5.

(Difficulty: 
$$\star$$
) Consider the Fourier basis  $\{\mathbf w^k\}_{k=0,\dots,N-1}$ , where  $\mathbf w^k[n]=e^{-j\frac{2\pi}{N}nk}$  for  $0\le n\le N-1$ .

Select the correct statement below.

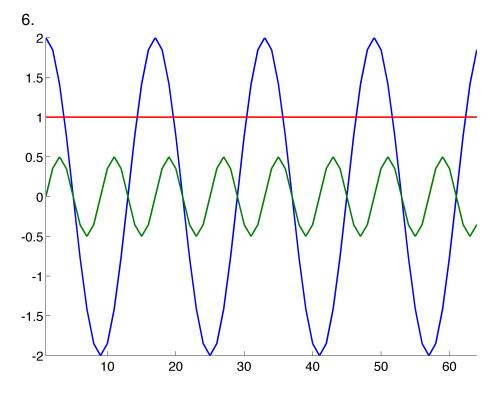

The elements of the basis are orthonormal:

$$\langle \mathbf{w}^i, \mathbf{w}^j 
angle = egin{cases} 1 & ext{ for } i=j \ 0 & ext{ otherwise.} \end{cases}$$

- The orthogonality of the vectors depends on the length N of the elements of the basis.
- The elements of the basis are orthogonal:

$$\langle \mathbf{w}^i, \mathbf{w}^j 
angle = egin{cases} N & ext{for } i=j \ 0 & ext{otherwise.} \end{cases}$$

Quiz, 9 questions

(Difficulty:  $\star\star$ ) Consider the three sinusoids of length N=64 as illustrated in the above figure; note that the signal values are shown from n=0 to n=63.

Call  $y_1[n]$  the blue signal,  $y_2[n]$  the green and  $y_3[n]$  the red. Further, define  $x[n]=y_1[n]+y_2[n]+y_3[n]$ .

Choose the correct statements from the list below. Note that the capital letters indicate the DFT vectors.

$$Y_2[k] = egin{cases} 16j & ext{for } k=8 \ 16j & ext{for } k=56 \ 0 & ext{otherwise} \end{cases}$$

$$Y_3[k] = egin{cases} 32 & ext{for } k=0 \ 32 & ext{for } k=64 \ 0 & ext{otherwise} \end{cases}$$

$$Y_1[k] = egin{cases} N & ext{ for } k=4,60 \ 0 & ext{ otherwise} \end{cases}$$

Quiz, 9 questions

7.

(Difficulty:  $\star\star\star$ ) Consider the length-N signal

$$x[n] = \cos\left(2\pi \frac{L}{M}n\right)$$

where M and L are integer parameter with  $0 < L \leq N-1$ ,  $0 < M \leq N$ .

Choose the correct statements among the choices below.

- The DFT X[k] has two elements different from zero if N=M and N 
  eq 2L.
- Consider the circularly shifted signal  $y[n]=x[(n-D)\mod N].$  In the Fourier domain, the two DFTs related by a modulation factor:  $Y[k]=X[k]e^{-j2\pi krac{D}{N}}.$
- In general, it will be easier to compute the norm of the signal  $\|\mathbf{x}\|_2$  in the Fourier domain, using the Parseval's Identity.
- If M=N and 2L < N , the signal has exactly L periods for  $0 \leq n < N$

Quiz, 9 questions

8.

(Difficulty:  $\star$ ) Consider an orthogonal basis  $\{\phi_i\}_{i=0,\dots,N-1}$  for  $\mathbb{R}^N$ . Select the statements that hold for any vector  $\mathbf{x}\in\mathbb{R}^N$ .

$$\|\mathbf{x}\|_2^2 = rac{1}{P} \sum_{i=0}^{N-1} |\langle x, \phi_i 
angle|^2$$
 if and only if  $\|\phi_i\|_2^2 = P \ orall i.$ 

$$\|\mathbf{x}\|_2^2 = \sum_{i=0}^{N-1} |\langle x, \phi_i 
angle|^2.$$

$$\|\mathbf{x}\|_2^2 = \sum_{i=0}^{N-1} |\langle x, \phi_i 
angle|^2$$
 if and only if  $\|\phi_i\|_2 = 1 \ orall i.$ 

$$\|\mathbf{x}\|_2^2 = rac{1}{P} \sum_{i=0}^{N-1} |\langle x, \phi_i 
angle|^2$$

if and only if  $\|\phi_i\|_2 = P \ orall i.$ 

Quiz, 9 questions

9.

(Difficulty:  $\star\star$ ) Pick the correct sentence(s) among the following ones regarding the DFT  ${\bf X}$  of a signal  ${\bf x}$  of length N, where N is odd.

Remember the following definitions for an arbitrary signal (asterisk denotes conjugation):

hermitian-symmetry: x[0] real and  $x[n] = x[N-n]^*$  for  $n=1,\ldots,N-1.$ 

hermitian-antisymmetry: x[0]=0 and  $x[n]=-x[N-n]^*$  for  $n=1,\dots,N-1.$ 

- If the signal  ${\bf x}$  is hermitian-symmetric, then the DFT  ${\bf X}$  is also hermitian-symmetric.
- If the signal  $\mathbf{x}$  is hermitian-symmetric, then its DFT is real.
- If the signal  ${\bf x}$  is purely real, then the DFT  ${\bf X}$  is purely imaginary.
- If the signal  ${\bf x}$  is hermitian antisymmetric, then its DFT  ${\bf X}$  is purely imaginary.
